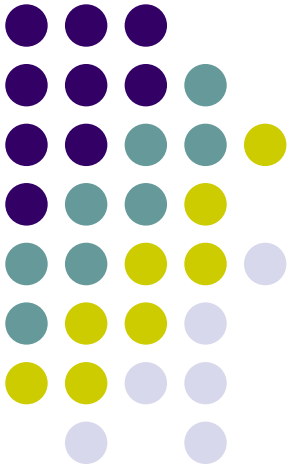
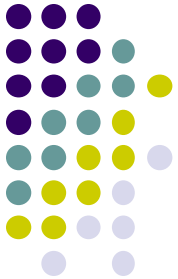
Practical Parallel Computing (実践的並列コンピューティング) 2021 No. 11

Part3: MPI (1)
May 20, 2021



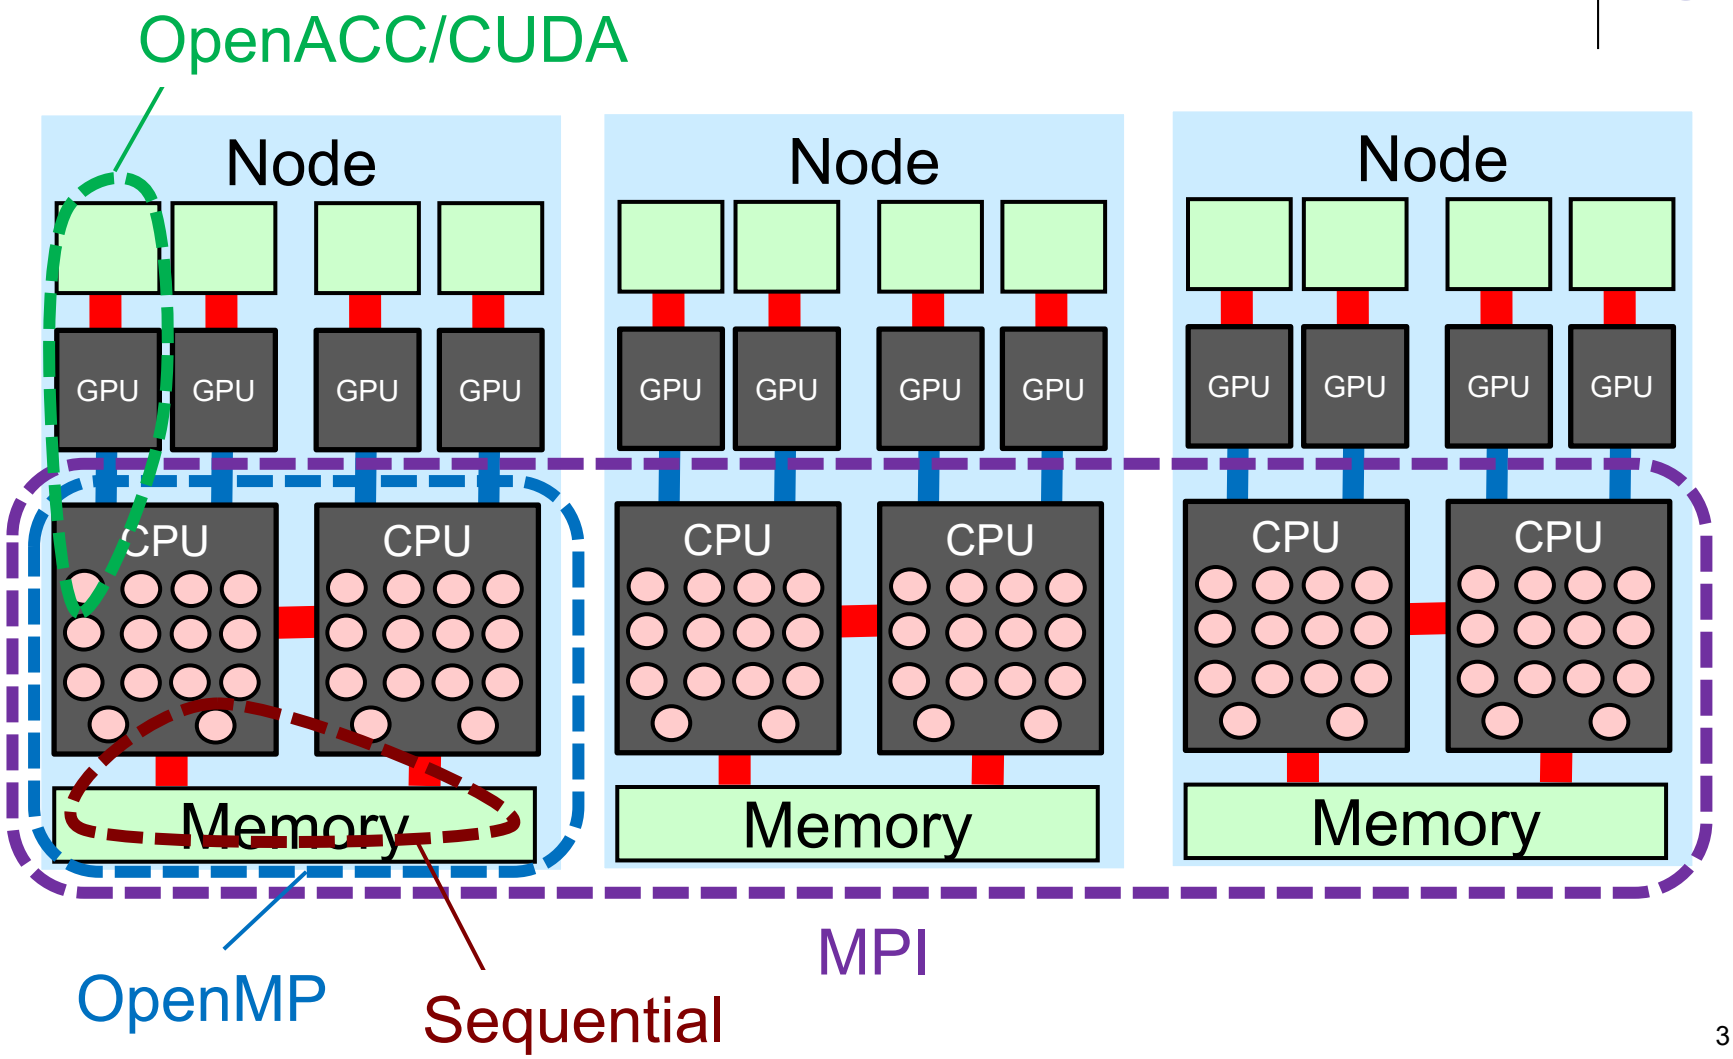
Toshio Endo
School of Computing & GSIC
endo@is.titech.ac.jp

Overview of This Course



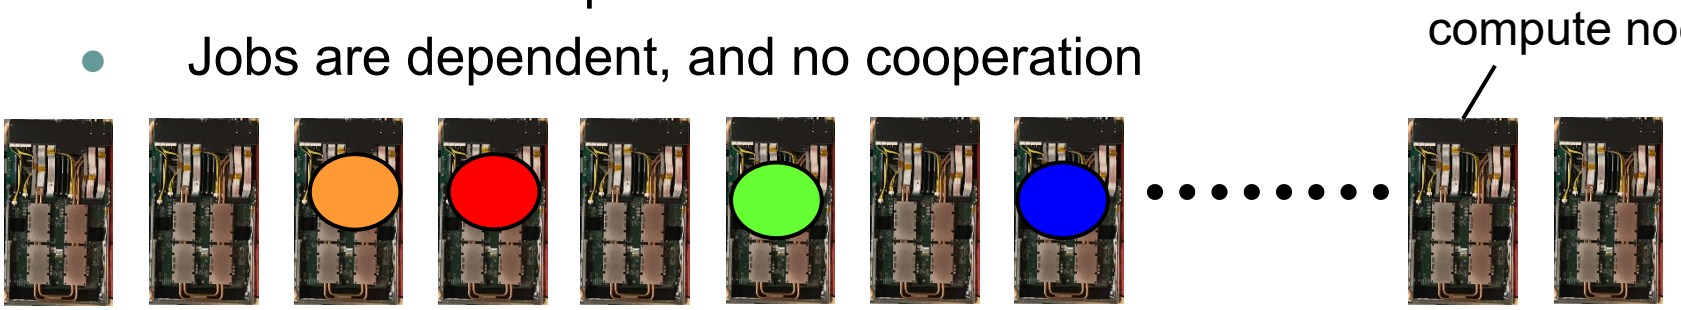
- Part 0: Introduction
  - 2 classes
- Part 1: OpenMP for shared memory programming
  - 4 classes
- Part 2: GPU programming
  - 4 classes ← We are here (1/4)
  - OpenACC (1.5 classes) and CUDA (2.5 classes)
- Part 3: MPI for distributed memory programming
  - 3 or 4 classes ← We are here (1/3~4)

Parallel Programming Methods on TSUBAME

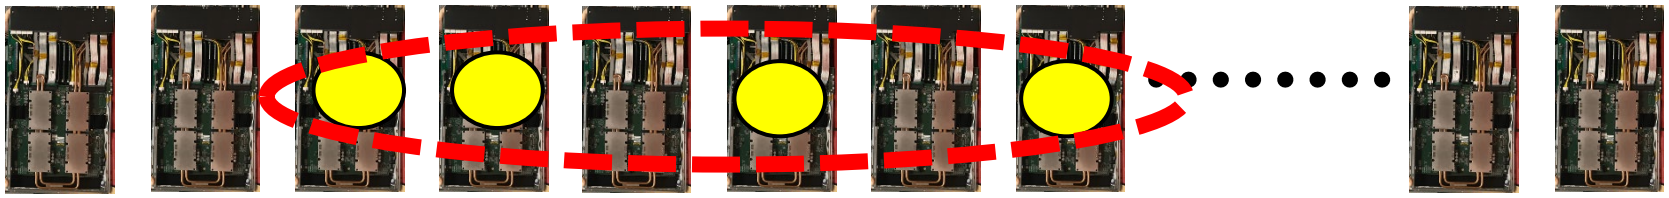


How We Can Use Many Nodes

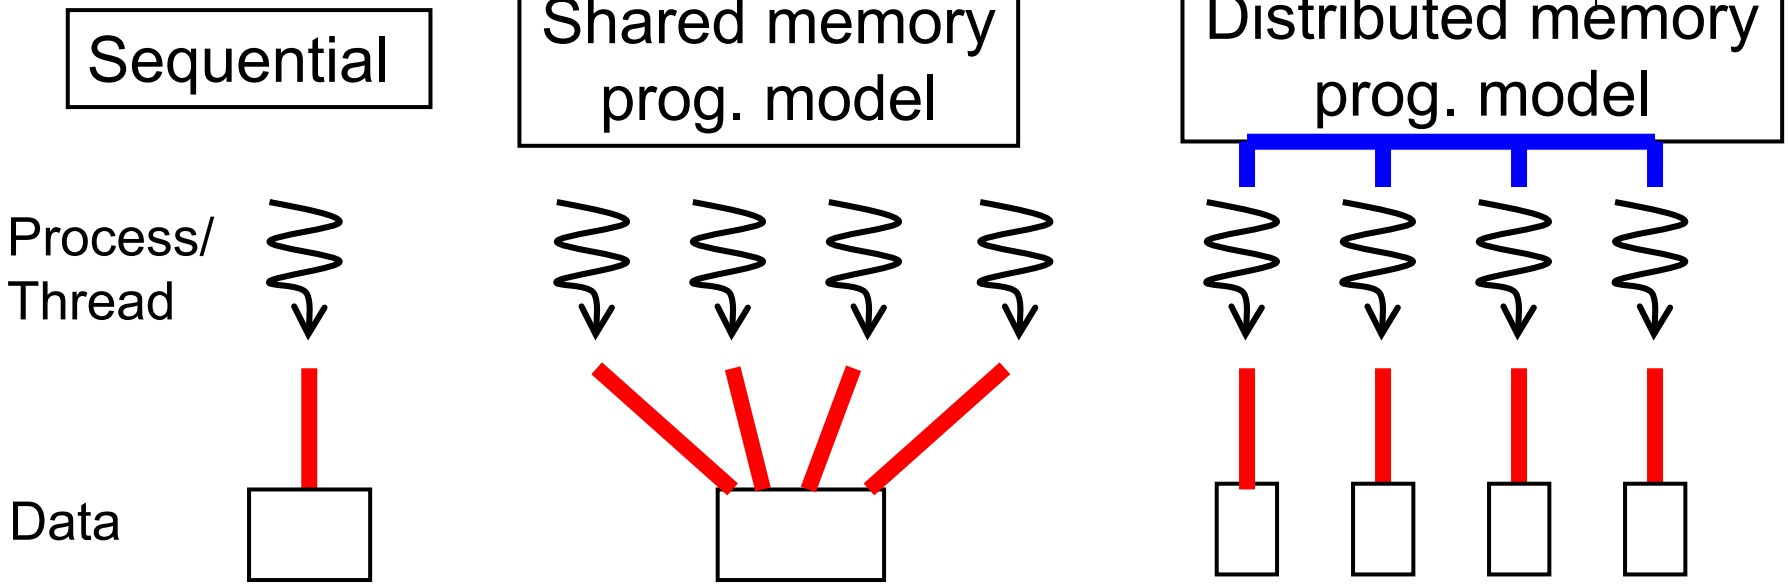
1. Submit several jobs into job scheduler
   - cf) Program executions with different parameters → Parameter Sweep
   - Jobs are dependent, and no cooperation



2. Use distributed memory programming → A single job can use multiple nodes
   - Socket programming, Hadoop, Spark…
   - And MPI



Classification of Parallel Programming Models

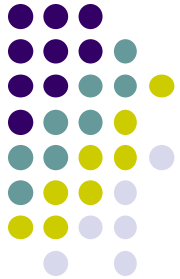


Programming without parallelsim

Threads have access to shared data
- OpenMP
- pthread
- Java thread…

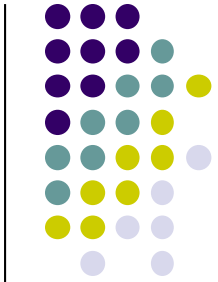
Need communication among processes
- MPI
- socket
- Hadoop, Spark…

MPI (message-passing interface)



- Parallel programming interface based on distributed memory model
- Used by C, C++, Fortran programs
  - Programs call MPI library functions, for message passing etc.
- There are several MPI libraries
  - OpenMPI (default) ← OpenMPI ≠ OpenMP ☹
  - Intel MPI, SGI MPE, MVAPICH, MPICH…

Differences from OpenMP



In MPI,

- An execution consists of multiple processes (not threads)
  - We can use multiple nodes ☺
  - The number of running processes is basically constant
- No variables are shared. Instead message passing is used
  - Data distribution has to be programmed
- No smart syntaxes such as “omp for” or “omp task” ☹
  - Task distribution has to be programmed ☹

First MPI Sample

- /gs/hs1/tga-ppcomp/21/hello-mpi

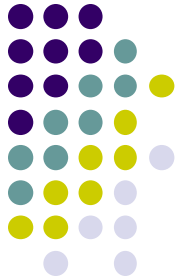
```
[make sure that you are at a interactive node (r7i7nX) ]
module load cuda openmpi    [Do once after login]
cd ~/t3workspace            [In web-only route]
cp -r /gs/hs1/tga-ppcomp/21/hello-mpi  .
cd hello-mpi
make
[An executable file "hello" is created]
mpiexec -n 7 --oversubscribe ./hello
```

Number of processes

Needed on the terminal (May 20, 2021)

Name of program (using options are ok)

Compiling and Executing MPI Programs



Case of OpenMPI library on TSUBAME3.0

- To compile
  - module load cuda openmpi, and then use mpicc
  - For sample programs, “make” command works

Required for module dependency☹

- To execute
  - mpiexec -n 7 --oversubscribe ./hello

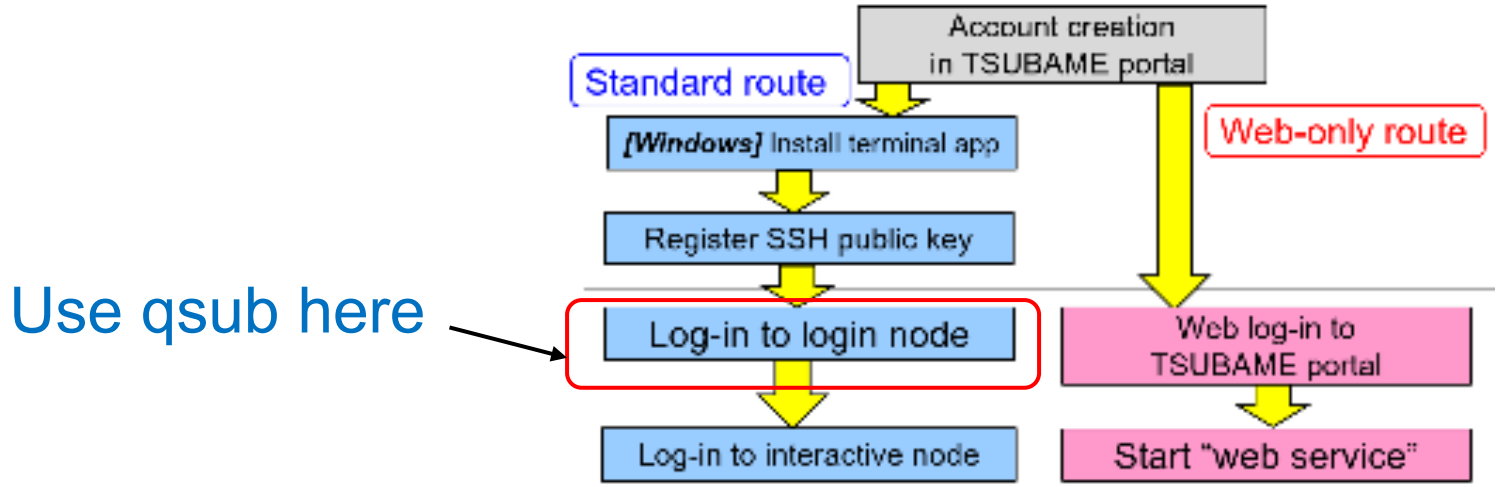
Number of processes

↑ These methods uses 1 (current) node.

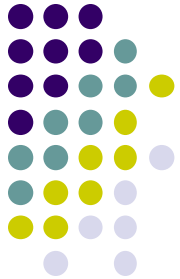
To use multi-nodes, we need “job submission” !

Notes on Job Submission in "Standard route"

- On an interactive node via "standard route", qsub/qstat commands may not be found
- Please use qsub/qstat on a login node
  - (out of iqrsh)



Submit an MPI Job (case of OpenMPI)



- We are going to execute it with 4 processes × 2 nodes = 8 processes

(1) Make a script file: job.sh

```
#!/bin/sh
#$ -cwd
#$ -l q_core=2
#$ -l h_rt=00:10:00

. /etc/profile.d/modules.sh
module load cuda openmpi

mpiexec -n 8 -npernode 4 ./hello
```

4core node x 2

Module preparation

Number of processes

Number of processes per node

Program name (and option)

※ --oversubscribe is not needed

(2) Submit the job with "qsub"

qsub job.sh

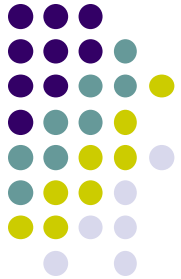
↑≦0:10:00 and ≦2nodes

qsub –g tga-ppcomp job.sh

↑ >0:10:00 or ≧3nodes

Be careful for TSUBAME point

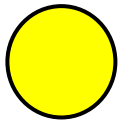
Notes in This Lecture
(Also see OpenMP(4) slides on Apr 29)



- Usually, avoid consumption of TSUBAME points
- 通常は無料利用の範囲にとどめてください
  - h_rt <= 0:10:00

- If necessary for reports, you can use up to 36,000 points in total per student
- 本講義のレポートの作成に必要な場合、一人あたり合計で36,000ポイントまで利用を認めます
  - f_node x 1node x 10 hours

- Please check point consumption on TSUBAME portal
- The TSUBAME group name is tga-ppcomp

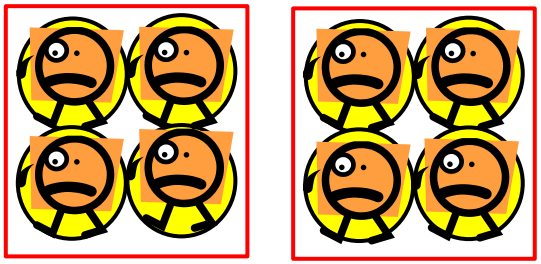


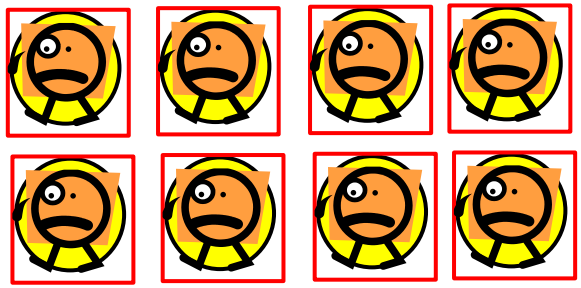
Nodes, Cores, MPI Processes

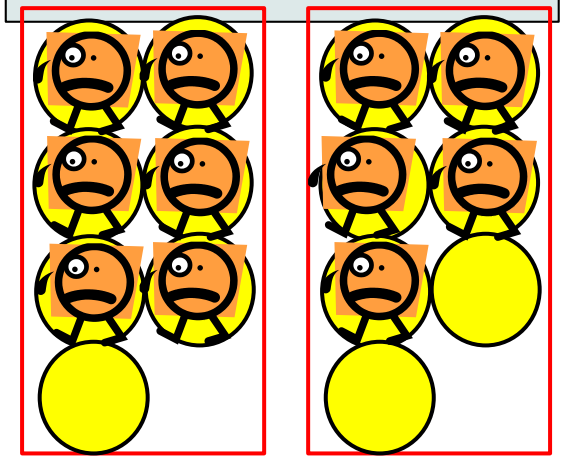
```
        :
#$ -l q_core=2
        :
mpirun –n 8 –npernode 4
  …
```

```
        :
#$ -l s_core=8
        :
mpirun –n 8 –npernode 1
  …
```

```
        :
#$ -l q_node=2
        :
mpirun –n 11 –npernode 6
  …
```







2 (virtual) nodes are prepared
Each node has 4 cores (q_core)

4 processes are created per node. Totally 8 are created
→ 2 nodes are used

8 (virtual) nodes are prepared
Each node has 1 cores (s_core)

1 processes are created per node. Totally 8 are created
→ 8 nodes are used

2 (virtual) nodes are prepared
Each node has 7 cores (q_node)

6 processes are created per node. Totally 11 are created
→ 2 nodes are used
(There are idle cores)

An MPI Program Looks Like

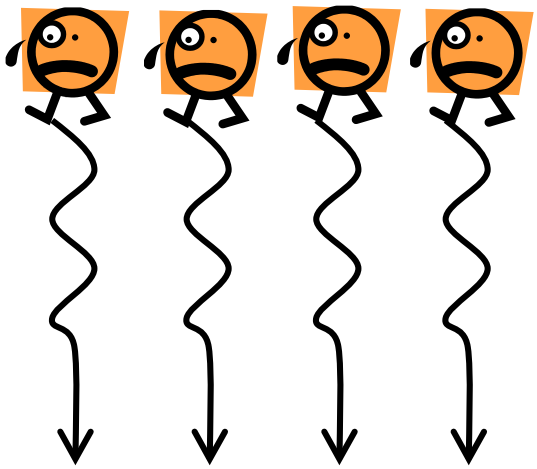
```
#include <stdio.h>
#include <mpi.h>

int main(int argc, char *argv[])
{
   MPI_Init(&argc, &argv);
   (Computation/communication)
   MPI_Finalize();
}
```

← Initialize MPI

← Finalize MPI

If number of processes=4

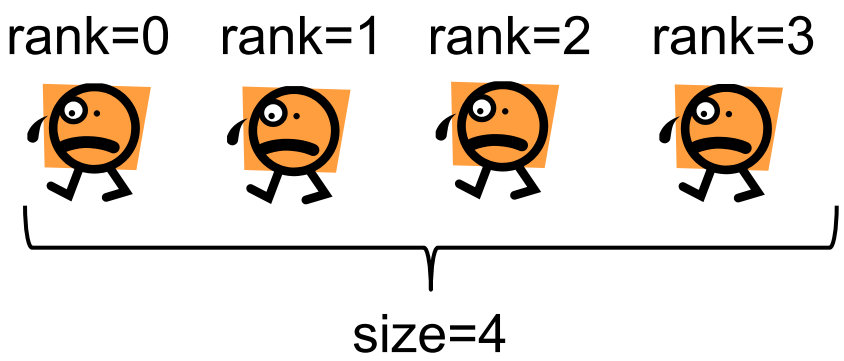


ID of Each MPI Process

- Each process has its ID (0, 1, 2…), called rank
  - `MPI_Comm_rank(MPI_COMM_WORLD, &rank);`

  → Get its rank
  - `MPI_Comm_size(MPI_COMM_WORLD, &size);`

  → Get the number of total processes
  - 0 ≦ rank < size
  - The rank is used as target of message passing



“mm” sample: Matrix Multiply

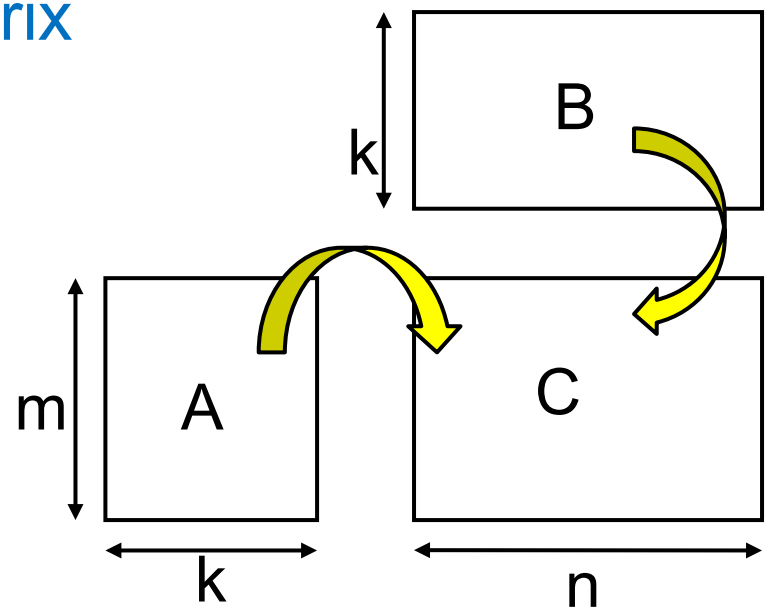
MPI version available at /gs/hs1/tga-ppcomp/21/mm-mpi/

A: a (m × k) matrix, B: a (k × n) matrix

C: a (m × n) matrix

C ← A × B

- Algorithm with a triple for loop
- Supports variable matrix size.
  - Each matrix is expressed as a 1D array by *column-major* format

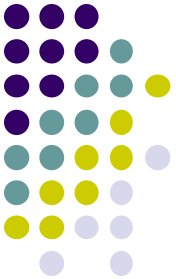


Execution:

mpiexec -n [np] --oversubscribe ./mm [m] [n] [k] (interactive)

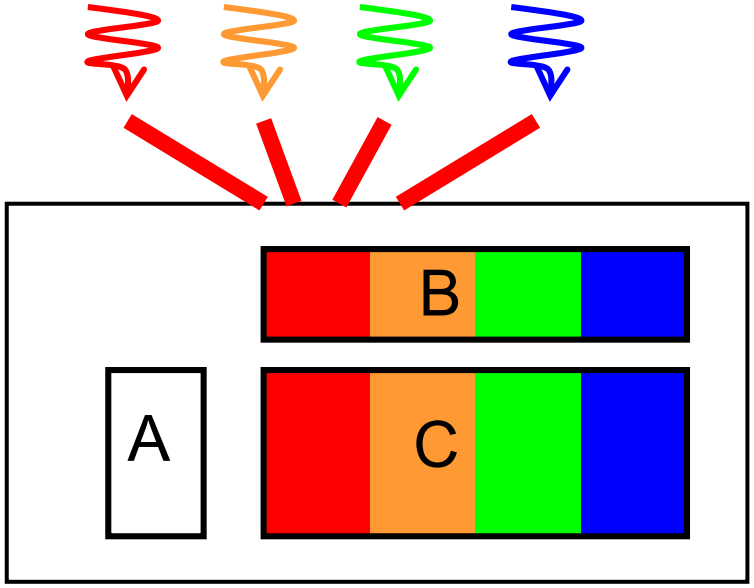
mpiexec -n [np] -npernode [nn] ./mm [m] [n] [k] (in job script)

Why Distributed Programming is More Difficult (case of mm-mpi)



Shared memory with OpenMP:

Programmers consider how computations are divided

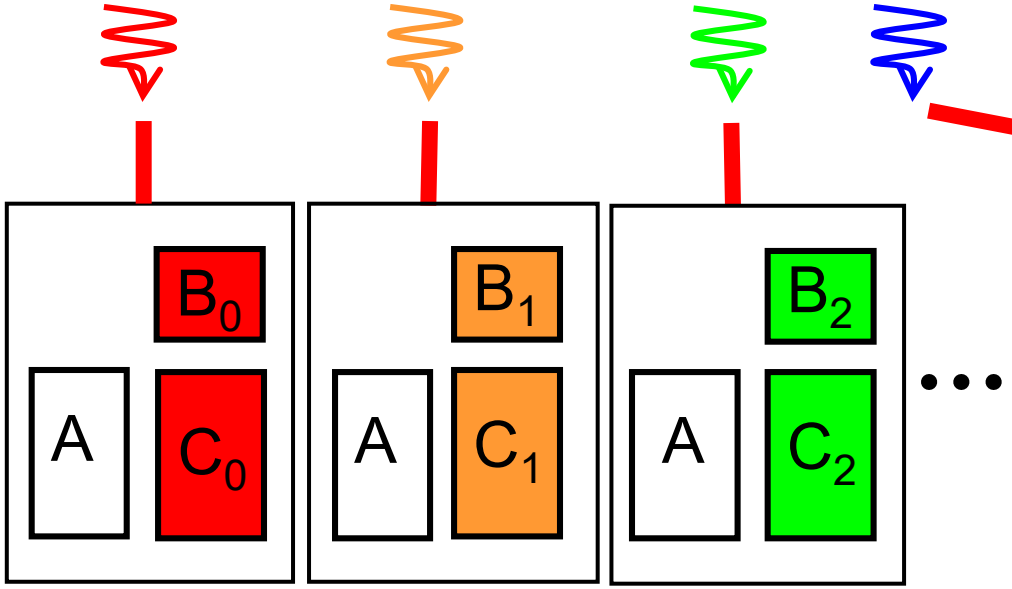


In this case, matrix A is accessed by all threads

→ Programmers do not have to know that

Distributed memory with MPI:

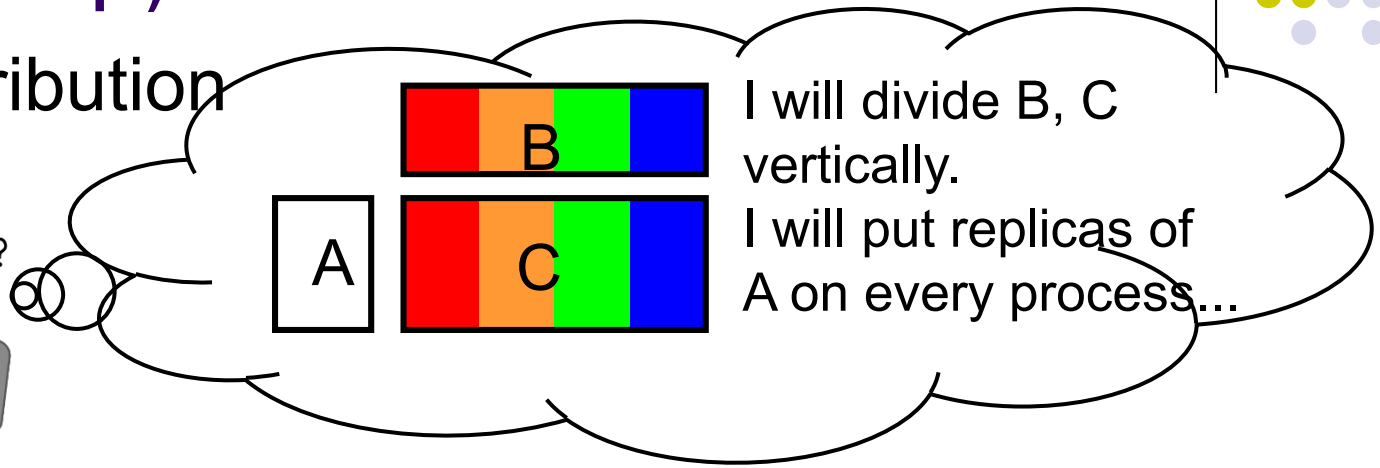
Programmers consider how data and computations are divided



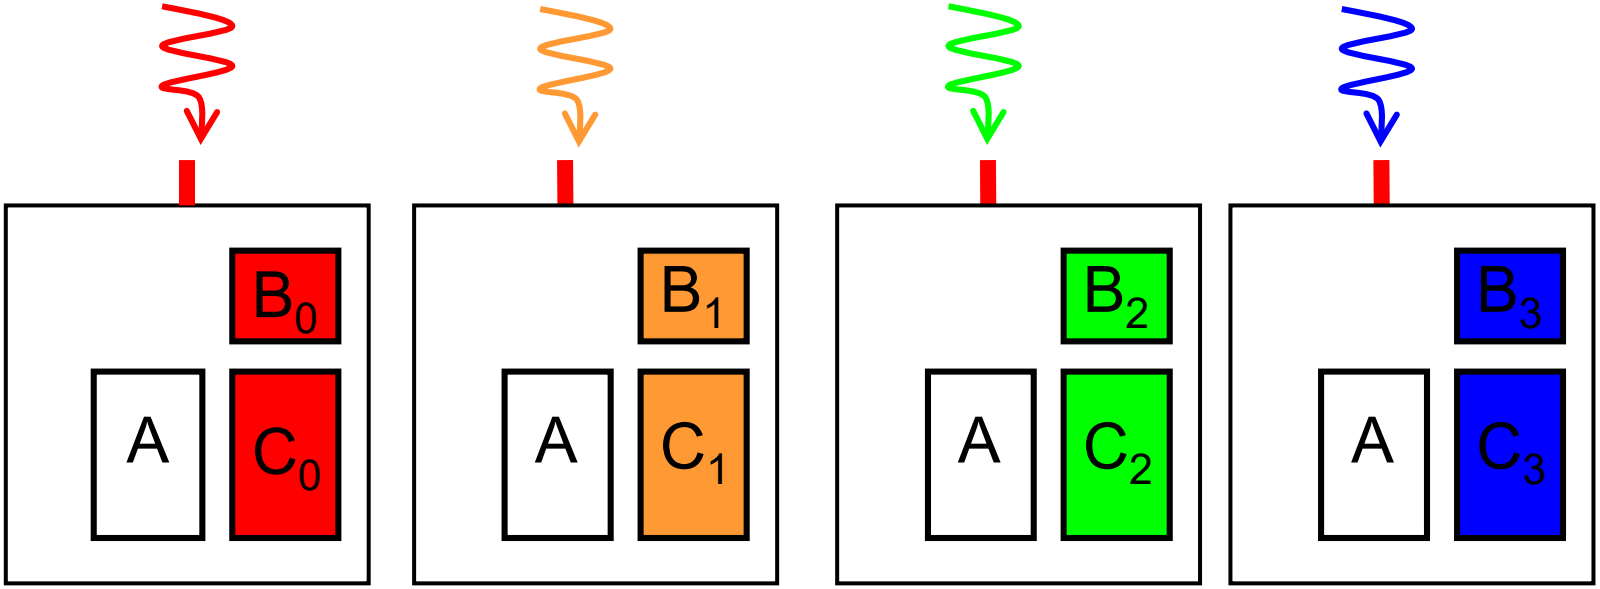
Programmers have to design which data is accessed by each process

Programming Data Distribution
(case of mm-mpi)

Design distribution method:



Programming actual location:



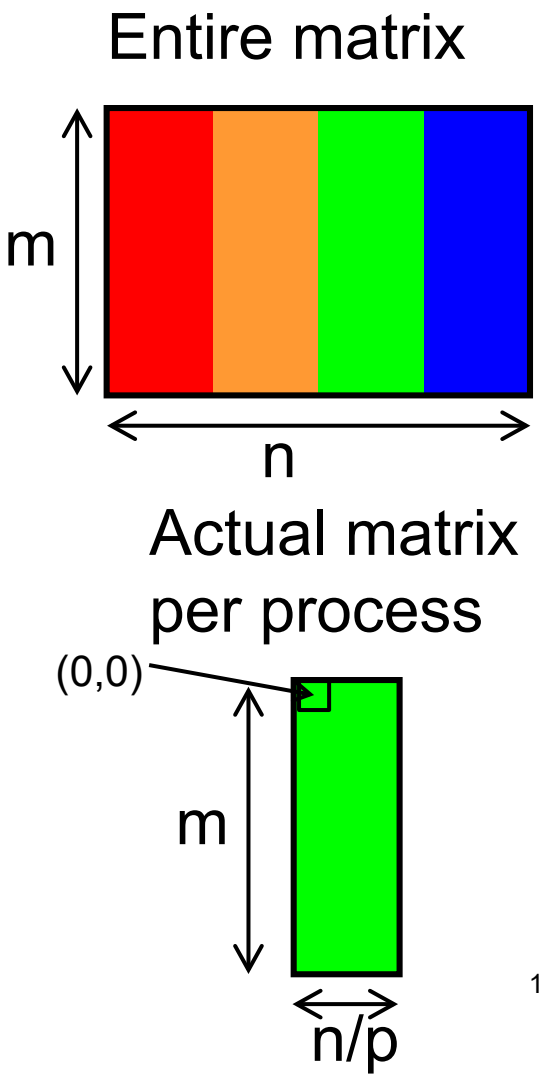
Programming Actual Data Distribution

- We want to distribute a $m \times n$ matrix among p processes
  - We assume n is divisible by p
- Each process has a partial matrix of size $m \times (n/p)$
  - We need to "malloc" m*(n/p)*sizeof(data-type) size
  - We need to be aware of relation between partial matrix and entire matrix
    - (i,j) element in partial matrix owned by Process r ⇔

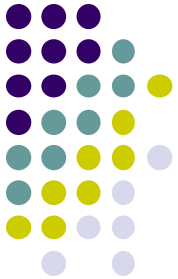
      (i, n/p*r + j) element in entire matrix

local index

global index

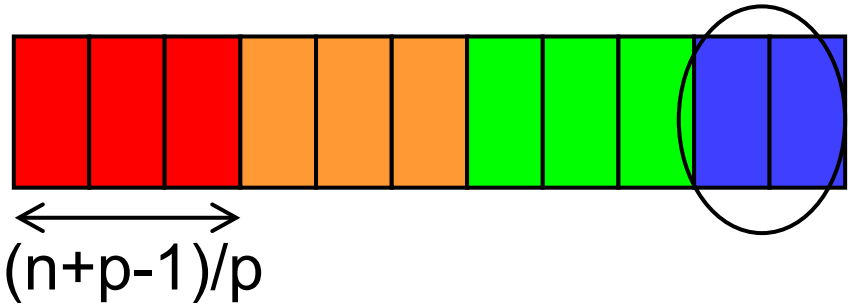


What is Done for Indivisible Cases



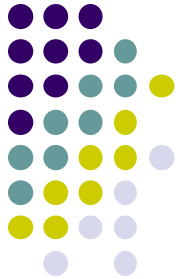
- What if data size n is indivisible by p?
- We let n=11, p=4
  - How many data each process take?
  - n/p = 2 is not good (C division uses round down). Instead, we should use round up division
  - → (n+p-1)/p = 3 works well

Note that the "final" process takes less than others

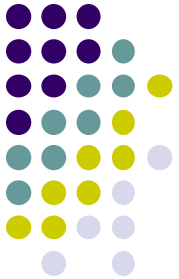


See divide_length() function in mm-mpi/mm.c
It calculates the range the process should take (first index s and last index e)

Notes in Time Measurement



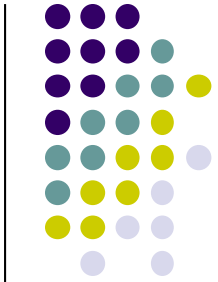
- In mm-mpi, gettimeofday() is used for time measurement
- For accurate measurement, we should call MPI_Barrier(MPI_COMM_WORLD) before measurement
  - This synchronizes all processes
  - All processes need to call this



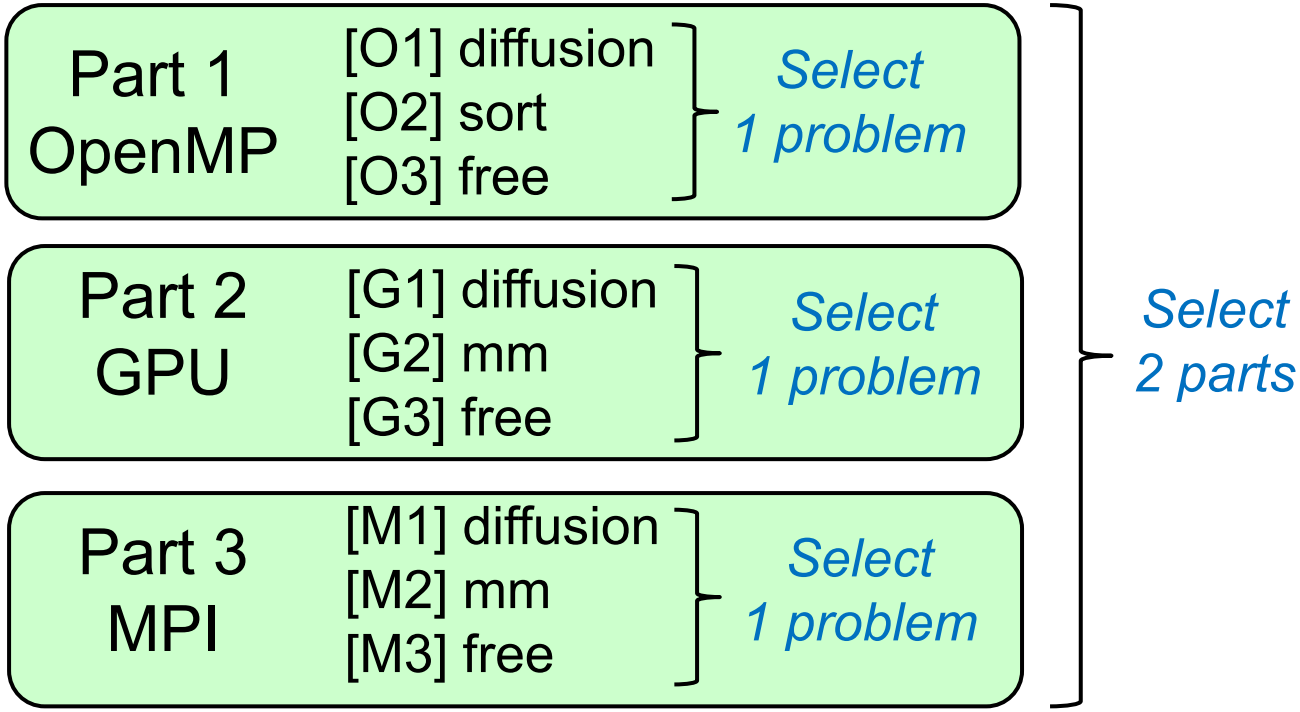
Some slides are deleted (and had bugs).

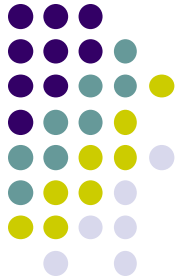
They are moved to May 24 slides

Assignments in this Course



- There is homework for each part. Submissions of reports for 2 parts are required





Assignments in MPI Part (1)

Choose one of [M1]—[M3], and submit a report

Due date: June 10 (Thursday)

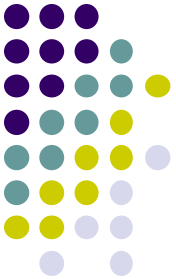
[M1] Parallelize “diffusion” sample program by MPI.

- Do not forget to change Makefile and job.sh appropriately
- Use deadlock-free communication
  - see neicomm_safe() in neicomm-mpi sample

Optional:

- To make array sizes (NX, NY) variable parameters
- To consider the case with NY is indivisible by p
  - see divide_length() in mm_mpi sample
- To improve performance further. Blocking, 2D division, etc

Assignments in MPI Part(2)

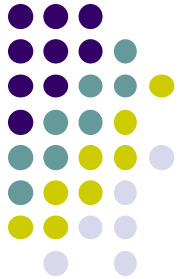


[M2] Improve “mm-mpi” sample in order to reduce memory consumption

Optional:

- To consider indivisible cases
- To try advanced algorithms, such as SUMMA
  - the paper “*SUMMA: Scalable Universal Matrix Multiplication Algorithm”* by Van de Geijn
  - http://www.netlib.org/lapack/lawnspdf/lawn96.pdf

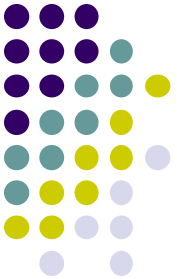
Assignments in MPI Part (3)



[M3] (Freestyle) Parallelize *any* program by MPI.

- cf) A problem related to your research
- More challenging one for parallelization is better
  - cf) Partial computations have dependency with each other

Notes in Report Submission (1)

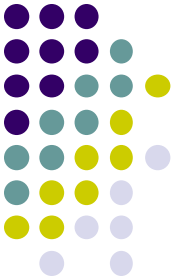


- Submit the followings via T2SCHOLA

  (1) A report document
  - PDF, MS-Word or text file
  - 2 pages or more
  - in English or Japanese (日本語もok)

  (2) Source code files of your program
  - Try “zip” to submit multiple files

Notes in Report Submission (2)



The report document should include:

- Which problem you have chosen
- How you parallelized
  - It is even better if you mention efforts for high performance or new functions
- Performance evaluation on TSUBAME
  - With varying number of processes

Updated on May 24

  - On a interactive nodes, 1 ≦ [number of processes] ≦ 14
  - For >7 processes, use “mpiexec -n [P] --oversubscribe …”
  - To use more CPU cores, you need to do “job submission”
  - With varying problem sizes
  - Discussion with your findings
  - Other machines than TSUBAME are ok, if available

Next Class

- MPI (2)
  - How to parallelize diffusion sample with MPI
    - Related to [M1]
